ABSTRACT EP 1281752 A1

An object of the present invention is to provide a method for drying the liquid of microorganism cells where, in a manufacturing step of a dried microorganism cell product or of a composition such as pharmaceutical or food containing the same, extinction or damage of microorganism cells is suppressed as much as possible and survival rate is able to be highly retained and another object is to provide a dried microorganism cell product in a single micron size having many cell numbers per unit weight and being easily made into pharmaceutical or food.

The present invention relates to a method for the manufacture of a dried microorganism cell product, characterized in that, sprayed liquid droplets in a single micron size are dried with drying wind and also to a dried microorganism cell product in a single micron size.

NATIONAL APPLIC. NO.: WO 2000EP6343 APPLIC. DATE: 20000705
LANGUAGE: English
ABSTRACT: A recombinant **Lactococcus lactis** capable of
delivering a **trefoil** peptide in vivo, is claimed. Also claimed
are: a method for the delivery of **trefoil** peptide to the

gastrointestinal tract; methods of treating **gastric** or **intestinal disease** or **disorders**, or lesions caused by these disorders; a method for producing a microorganism able to deliver **trefoil** peptide by transforming a microorganism with a recombinant vector carrying a **trefoil** peptide coding sequence under the control of promoter and a secretion signal sequence; and a recombinant vector containing a **trefoil** peptide coding sequence under the control of a promoter sequence and a secretion signal sequence. The recombinant microorganism is useful for manufacturing an agent for the delivery of a **trefoil** peptide to the gastrointestinal tract, and for treating **gastric** or **intestinal diseases**, or lesions caused by **gastric** or **intestinal diseases** or **disorders**. The microorganism may be used for preparing medicament to be used for treating disease, etc. Disease states which can be treated by composition containing the recombinant microorganism or **trefoil** peptides, include disorders of and damage to alimentary canal. The cytokine interleukin-10 (IL-10) has shown promise in clinical trials for treatment of inflammatory bowel disease (IBD). Using two mouse models, we show that the therapeutic dose of IL-10 can be reduced by localized delivery of a bacterium genetically engineered to secrete the cytokine. Intragastric administration of IL-10-secreting *Lactococcus lactis* caused a 50% reduction in colitis in mice treated with dextran sulfate sodium and prevented the onset of colitis in IL-10 SUP - SUP / SUP - mice. This approach may lead to better methods for cost-effective and long-term management of IBD in humans.

ABSTRACT: Genetically modified *Lactococcus lactis* secreting interleukin 10 provides a therapeutic approach for inflammatory bowel disease. However, the release of such genetically modified organisms through clinical use raises safety concerns. In an effort to address this problem, we replaced the thymidylate synthase gene thyA of *L. lactis* with a synthetic human IL10 gene. This thyA - hIL10(+) *L. lactis* strain produced human IL-10 (hIL-10), and when deprived of thymidine or thymine, its viability dropped by several orders of magnitude, essentially preventing its accumulation in the environment. The biological containment system and the bacterium's capacity to secrete hIL-10 were validated in vivo in pigs. Our approach is a promising one for transgene containment because, in the unlikely event that the engineered *L. lactis* strain acquired an intact thyA gene from a donor such as *L. lactis* subsp. cremoris, the transgene would be eliminated from the genome.

ABSTRACT: The development of novel approaches that allow for accurate targeting of therapeutics to the bowel mucosa is a priority in the research on inflammatory bowel disease. We have engineered **Lactococcus lactis** to secrete soluble, fully active, correctly processed cytokines. We have used these live, recombinant strains for the in situ delivery of mouse interleukin (mIL)-2, -6 and -10 at airway mucosa or mucosa of the colon. Strains that secrete mIL-2 or mIL-6 and produce TTFC intracellular show a higher level of anti-TTFC induction in mice following intranasal inoculation. We showed that mIL-10 producing **L. lactis** can prevent and cure enterocolitis in mice. The daily ingestion of this strain leads to the prevention of **colitis** in IL-10 -/- 129 Sv/Ev mice. The repeated addition of DSS to the drinking water of Balb/c mice leads to the induction of chronic **colitis** with a typical mean histological score of five points. Subsequent daily treatment with 108 IL-10 producing **L. lactis** reduced the inflammation to a score of approximately 1 in 40% of the treated mice, which is a status equal to that of healthy control mice. Most other animals from the treated group only showed minor patchy remnants of the inflammation. Killing of the IL-10 producing bacteria by UV irradiation immediately prior to inoculation abrogates this therapeutic effect. Therefore it can be attributed to the active in vivo delivery of IL-10. We have further documented this by demonstrating in situ de novo synthesis of IL-10 in the colon of IL-10 -/- mice.

NATIONAL APPLIC. NO.: WO 2002EP4942 APPLIC. DATE: 20020503

LANGUAGE: English

ABSTRACT: DERWENT ABSTRACT: NOVELTY - An isolated strain of **Lactococcus** sp. comprising a defective thymidylate synthase gene, is new. DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following: (1) a pharmaceutical composition comprising the novel isolated strain; and (2) a transformed strain of **Lactococcus** sp., comprising a transforming plasmid that does not comprises an intact thymidylate synthase gene. BIOTECHNOLOGY - Preferred Isolated Strain: The gene is preferably inactivated by gene disruption. The **Lactococcus** sp. is preferably **Lactococcus lactis**. Preferred Transformed Strain: The transformed strain further comprises a gene encoding a prophylactic and/or therapeutic molecule, preferably interleukin-10. ACTIVITY - Antiinflammatory. No biological data is given. MECHANISM OF ACTION - Interleukin-Agonist-10; Thymidylate-Synthase-Inhibitor. USE - The strain of **Lactococcus** sp. is useful as host strain for transformation. The transformed strain of **Lactococcus** sp. is useful for the delivery of prophylactic and/or therapeutic molecules. The pharmaceutical composition is useful for the preparation of a medicament to treat inflammatory bowel diseases. (All claimed.) The inflammatory bowel disease is **Crohn's** disease. EXAMPLE - The regions flanking the sequence were cloned from **Lactococcus lactis** MG1363. The thyA replacement was performed by making suitable replacements in a plasmid borne version of the thyA target. The thyA gene was replaced by a synthetic gene encoding a protein which has the **Lactococcus lactis** Usp45 secretion leader fused to a protein of identical amino acid sequence. At the 5' end the insertion is performed in such a way that the ATG of thyA is fused to the P1-T7Usp45-hIL-10 expression unit. At the 3' end and ACTAGT SpeI restriction site was engineered immediately adjacent to the TAA stop codon of the usp45-hIL-10 sequence. This was ligated in a TCTAGA XbaI restriction site. The resulting strains are thyA deficient, a mutant not yet described for **L. lactis**, and strictly dependent upon the addition of thymidine or thymine for growth. (65 pages)

ABSTRACT: Use of a cytokine-producing or cytokine antagonist-producing Gram-positive bacterial strain in the preparation of a medicament treat inflammatory bowel disease. The bacteria are used in the treatment of inflammatory bowel diseases, especially chronic **colitis**, **Crohn** disease or an **ulcerative colitis** (claimed). The use of non-colonizing bacteria expressing cytokines or cytokine antagonists allows the treatment to be directed to the disease site, whilst minimizing the possibility of degradation along the gastrointestinal tract. In an example, Sv/Ev interleukin-10 (IL-10)-/- mice spontaneously developed a generalized enterocolitis between 3-8 weeks of age. 129 Of these animals were treated at 3 weeks old for 6-8 weeks with a daily intragastric inoculation of IL-10 producing **Lactobacillus lactis**. The non-treated mice showed a histological score of 4.5 points whereas the treated mice showed a score of 1.5 points, indicating that the treatment successfully reduced the development of **colitis** in mice. The preferred bacteria are *Bacillus subtilis*, *Streptococcus gordonii*, *Staphylococcus xylosus* and *L. lactis*. (39pp)
